A: The latest version of Chrome is 128-bit encrypted. That means that you can encrypt your data with 128-bit keys, which means that the hacker cannot break your encryption. To see if your data is encrypted by Chrome, you can go to the following link and see if the data is encrypted or not. If you have a server-side solution that you are using to encrypt data, then that is much more secure than keeping data on the client side, and also reduces the attack surface. If you want to keep the data on the client side, then this is the solution you will need to look at. Management of drug-induced lung disease. This article describes approaches to the diagnosis and management of drug-induced lung disease (DILD). Diagnosis is usually based on exclusion of other possible etiologies, including infection. The most common, and most severe, cause is acute hypersensitivity pneumonitis. The acute form is associated with airway obstruction or hypoxemia, fever, and a new, non-productive cough. In the chronic form, a bronchodilator effect is typically observed; this is usually caused by hypersensitivity to a bronchodilator, particularly beta2-adrenergic agonists. Inhaled corticosteroids may be effective in both forms. Other types of DILD are rare. New drugs are frequently associated with DILD. Preclinical studies may reveal some potential for lung toxicity. Suspected DILD should be managed aggressively with careful exclusion of alternative etiologies, such as infection. MRI in the evaluation of lumbar herniated discs. Forty-six patients with suspected lumbar disc herniations were examined prospectively with MRI. Diagnosis was made at surgery (n = 16) or clinical follow-up (n = 30) at a mean of 37 months. The patient population consisted of 22 men and 24 women, mean age 42.5 years. The herniated discs were all located at L4-L5 (n = 20), L3-L4 (n = 14), L5-S1 (n = 13), L4-S1 (n = 10), and L3-S1 (n = 1). Diagnosis at surgery or clinical follow-up was consistent with MRI in all cases. Of the 16 herniated discs diagnosed at surgery, 16 were correctly identified on MRI, one was seen but interpreted as a solid mass,
